Individual Project Proposal: Yolanda Chen

I would be creating a python program that would output the number of deaths, recovered, and confirmed cases globally from the coronavirus when the user inputs a date. If the user inputs a country, the program would add all of the inputs up and show the total number of confirmed cases, deaths, and recovered. I chose this topic because as an international student, my family and I have been closely monitoring these statistics to see if it's safe to go travel (US, specifically, since I'm a Purdue Student). I believe that coronavirus is a hot topic that everyone's interested in and it would be helpful if people could just search for the date/country their curious in and have the answers, instead of searching through a list of dates/countries.
